ABOUT ME

Hey, I'm Adi

I'm a data-driven Senior Product Designer with more than 5 years of experience, specializing in high-traffic B2C and SaaS products. I turn user research, A/B testing, and behavioral data into interfaces that measurably lift engagement and conversion.

I own the full design lifecycle - from user flows and research through high-fidelity UI and prototypes - partnering closely with fast-paced product and engineering teams to balance user needs with business goals and technical constraints. For me, good design isn't a matter of taste; it's a hypothesis you test, measure, and refine.

DATA-DRIVEN UX RESEARCH B2C & SAAS A/B TESTING

Contact me + **View my work ↗**

BACKGROUND

My Story

Design and art have been a constant thread in my life - from early childhood sketches, through a bachelor's degree in design, into every role I've taken since. **Making things with my hands and watching an idea become real** has always been where I do my best thinking.

Alongside the craft, I've always been fascinated by psychology - why people behave the way they do, what drives a decision, where attention goes and why. The moment I realized product design sits exactly at the intersection of those two worlds, the path was obvious: **UX wasn't just a career choice - it was the alignment of everything I care about.**

That intersection still shapes how I work today. I dive deep into research to uncover real user insight, treat data as the sharpest design tool I have, and hold my work to a double standard: it has to be visually precise **and** resonate with the people using it. I learn fast, adapt faster, and I'm at my best when the problem is messy and the bar is high.

📊

Evidence over opinion

Every design decision starts with research and ends with measurement. When something can't be validated up front, I ship it as a hypothesis and measure it.

🧠

Psychology-first UX

Understanding how people think, decide, and behave is the foundation of every flow I design - not a nice-to-have layered on at the end.

⚡

Craft under constraints

Real products live between user needs, business goals, and technical limits. I design for that reality - at pace, without cutting corners.

roundforest • INTERNAL AI PLATFORM

Turning a six-tool ad workflow into one AI production platform.

MY ROLE	TEAM	DURATION
Senior Product Designer Research · UX · UI · Front-end build	**1 PM · 1 Engineer** Lean squad	**1 month**

TL;DR

Background	Roundforest's Meta acquisition depends on testing a high daily volume of ad creatives. CopyCat is the internal AI platform that produces them.
Problem	Output was capped at 70–100 creatives a day across six disconnected tools. Profitable scale needed 500+.
Approach	Two weeks embedded with the team, then one task-driven platform: a guided wizard, AI drafts, and human review gates. I built the new front end myself.
Outcome	700+ creatives a day with the same team. 75% less production time, and 6 tools consolidated into 1.

700+
creatives a day, up from 70–100

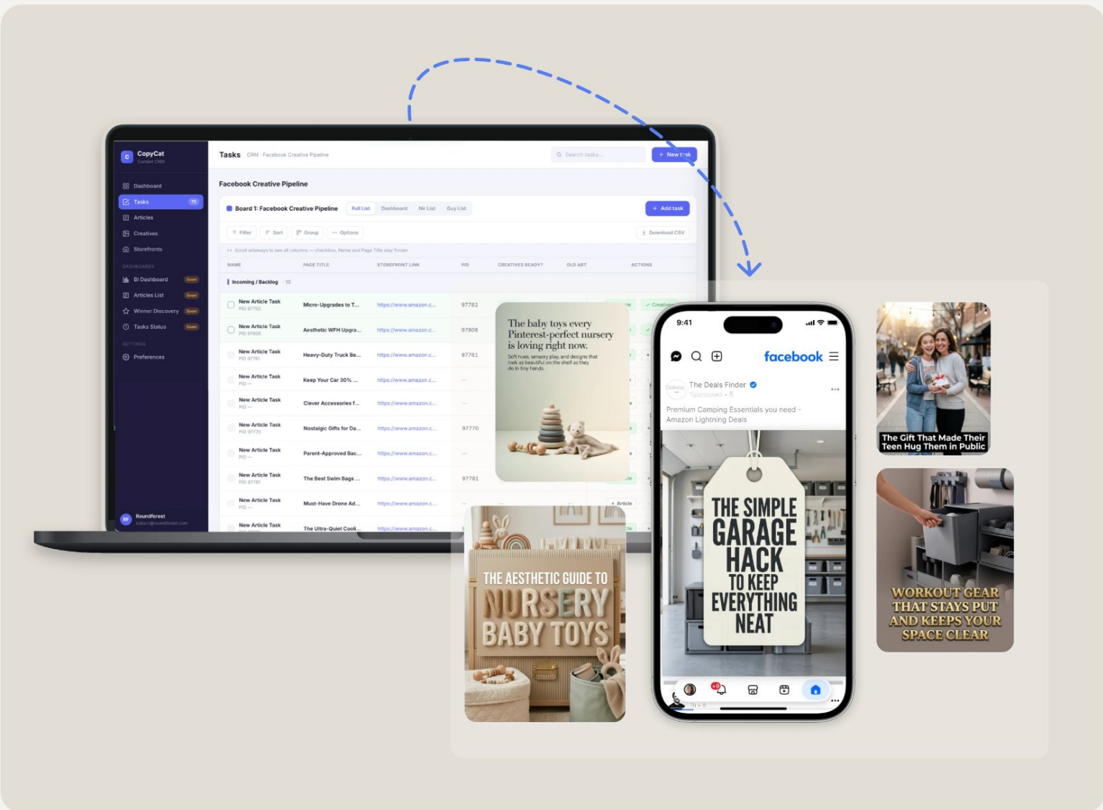
Try it

BACKGROUND

Profitable Meta acquisition runs on creative volume.

Roundforest wins on Meta by testing many ad creatives every day. I led UX and UI for **CopyCat**, the internal AI platform that turns a product task into a landing-page article and a set of ad creatives.



Tasks
Facebook Creative Pipeline
facebook
The baby toys every Pinterest-perfect nursery is loving right now.
THE AESTHETIC GUIDE TO NURSERY BABY TOYS
THE SIMPLE GARAGE HACK TO KEEP EVERYTHING NEAT
The Gift That Made Their Teen Hug Them in Public
WORKOUT GEAR THAT STAYS PUT AND KEEPS YOUR SPACE CLEAR

PROBLEM

A faster process that became harder to run.

A no-code system had already lifted output by 30%. But it lacked context and didn't fit the team's workflow, so they stitched together six tools around it. Production got faster and much more complex.

70–100	~130	500+
today	breakeven	profitable scale

BEFORE ~~Google Sheets~~ ~~Asana~~ ~~Gemini~~ ~~Ideogram~~ ~~Kueez CMS~~ ~~CopyCat (old)~~

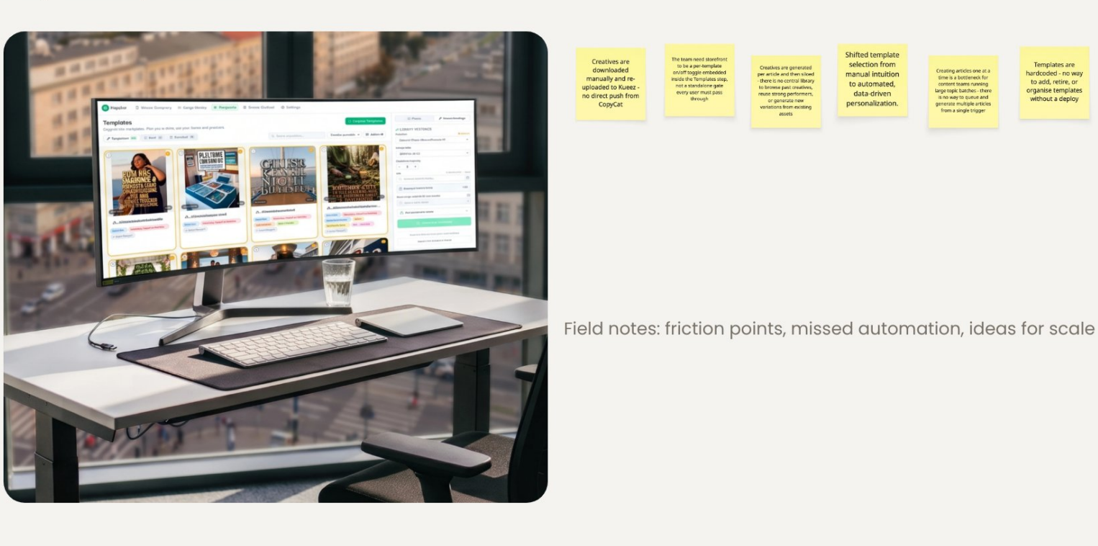
AFTER CopyCat · one end-to-end workflow

> If we fix efficiency, we can at least double output.

RESEARCH

Two weeks inside the Meta acquisition team.

I joined the team for two weeks to experience the workflow from the inside: the real pain points, the constraints, and the gaps between their tools and what they actually needed.



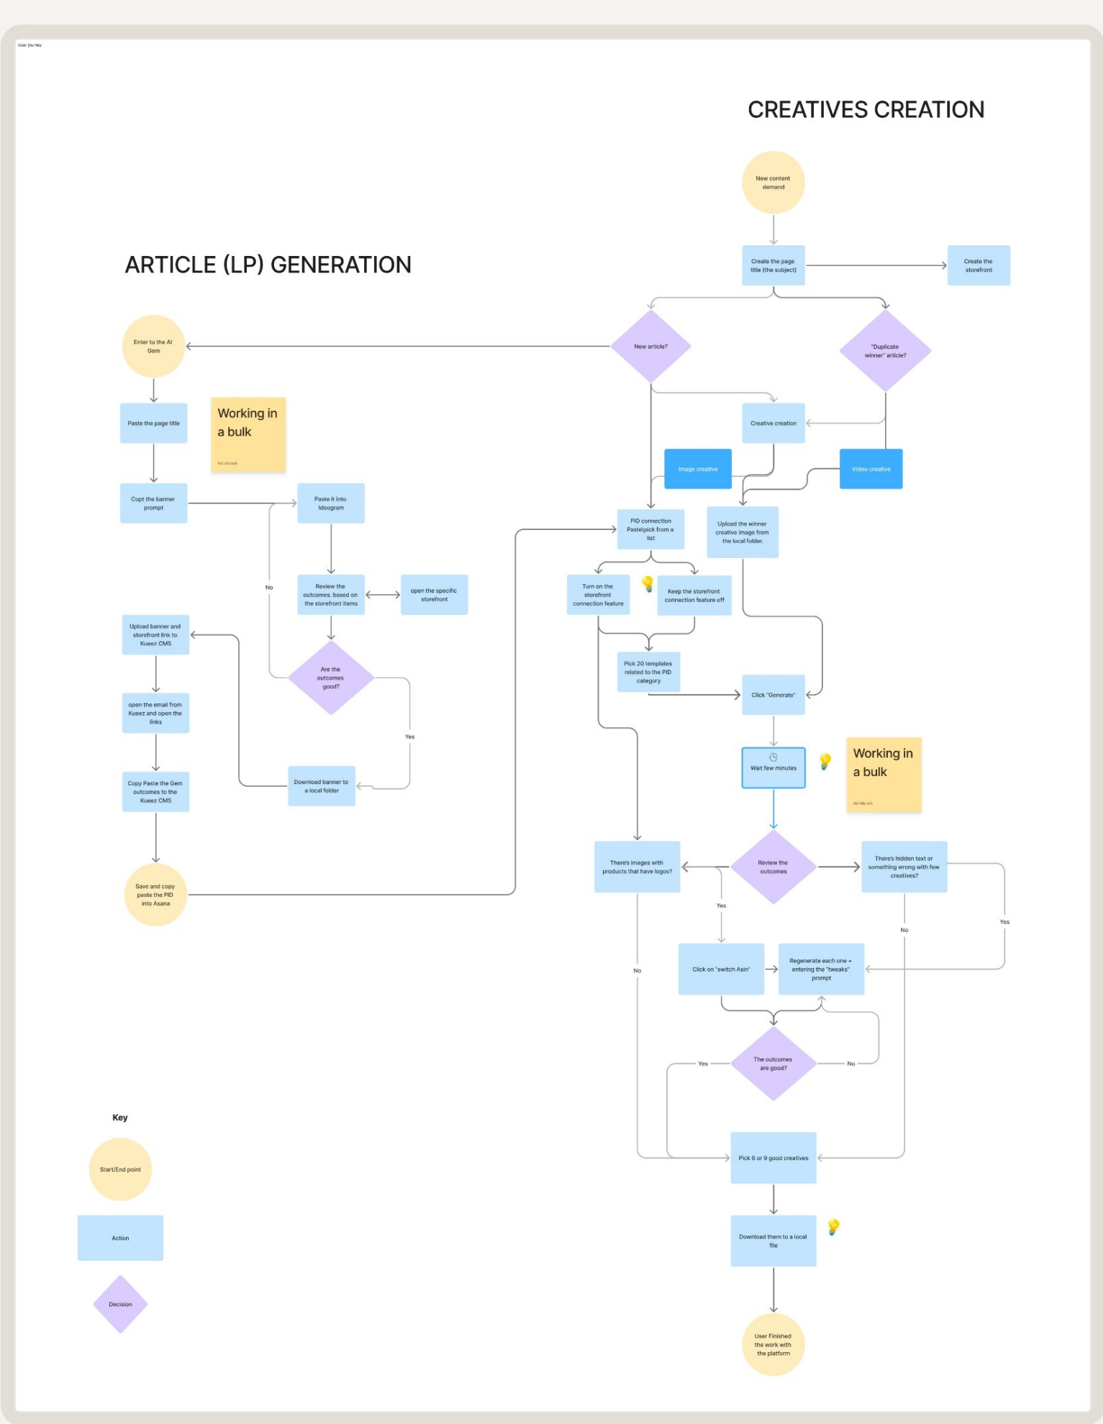
Field notes: friction points, missed automation, ideas for scale

MAPPING

Mapping the workflow showed where it broke.

I mapped everything from ideation to campaign launch. It surfaced redundant steps, tool fragmentation, and clear room to consolidate and automate.

Ideation → Article → Creatives → Campaign → Testing



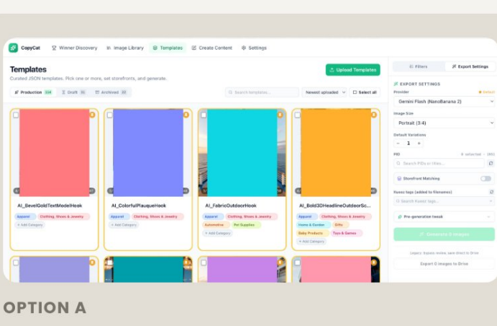
View the full map →

Unify	Automate	Review
Replace six disconnected steps with one continuous flow.	Data handling, layout and asset generation, with no manual work.	Keep people in charge where quality and cost are at stake.

DECISION

I chose a guided wizard over one big screen.

The biggest call was how to structure creation. Keeping the familiar layout was safe. I chose to redesign it, knowing it carried a real risk.

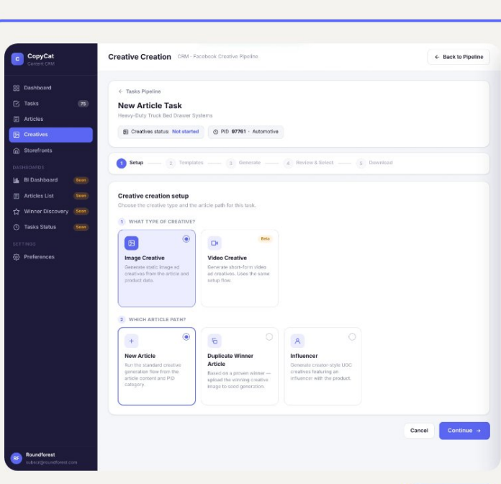


OPTION A

Improve the existing screen

Every tool and setting always on display, with no enforced order.

Keeps the clutter, and steps stay easy to skip.



OPTION B CHOSEN

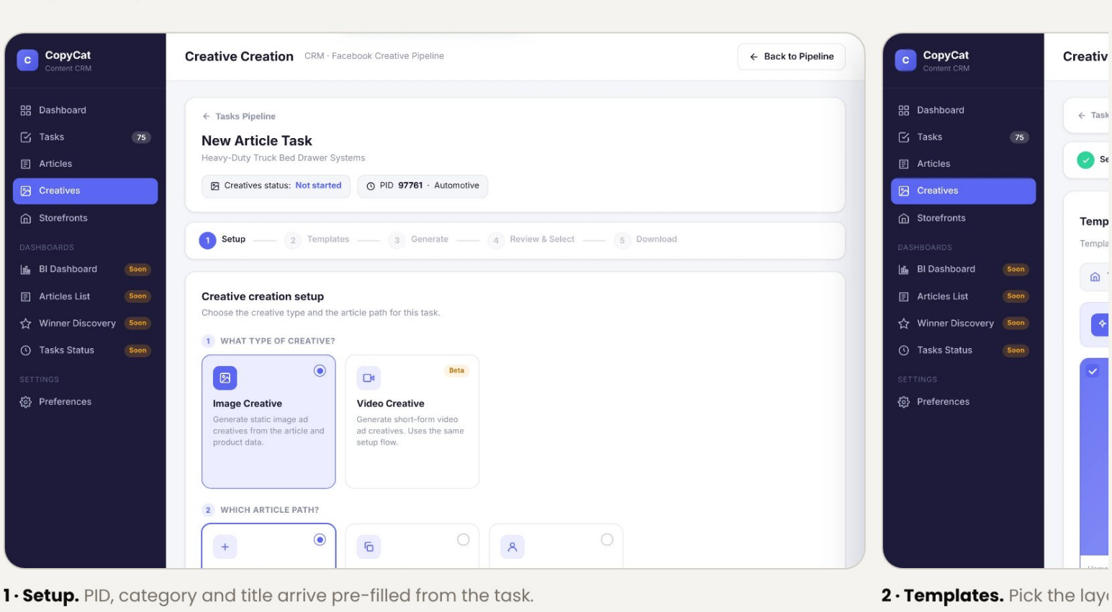
A guided wizard

A fixed sequence where each step unlocks the next.

Risk: the team relearns a tool they use daily.

The five steps

Setup → Templates → Generate → Review & select → Download



Tasks Pipeline

Creative creation setup
Choose the creative type and the article path for this task.
WHAT TYPE OF CREATIVE?
WHICH ARTICLE PATH?

1 · Setup. PID, category and title arrive pre-filled from the task.

2 · Templates. Pick the lay

1 / 5

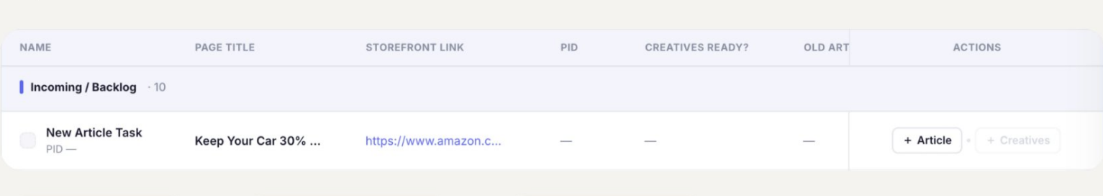
The team changes often	Order prevents errors	Short learning, long payoff
A tool that teaches its own process beats familiarity.	No more skipped or out-of-order steps.	The structure keeps paying off as volume grows.

> To get the PM and engineer on board, I built the new front end myself on the existing system, so the redesign added no backend work.

SOLUTION

One task list drives the whole flow.

Every day starts from the task list. Each task carries the data needed to generate its article and its creatives, so nobody re-types anything between steps.



NAME	PAGE TITLE	STOREFRONT LINK	PID	CREATIVES READY?	OLD ART	ACTIONS
Incoming / Backlog · 10						
New Article Task PID —	Keep Your Car 30% ...	https://www.amazon.c...	—	—	—	+ Article + Creatives

Generate article → Generate creatives → Review & approve

Single source of truth	Intentional review gates
Task rows hold all metadata, so creation needs no manual entry.	Generation costs money, so a person approves before anything moves on.

Clear status	Dashboard tab
Finished tasks turn green before handoff to PPC.	Throughput and bottlenecks by owner and category, with no spreadsheet export.

The whole flow in 30 seconds

From a task row to an article, through the five creative steps, and back to the list.

AI REVIEW

AI drafts. People decide.

CopyCat uses GPT, Gemini and Ideogram for article text, banners and ads. Quality varies and every generation costs money, so the interface treats AI output as a **first draft**.

Label the source	Regenerate one field	Options, not one answer	Edit, swap or upload	A person saves
Fields are tagged "auto-filled from task" or "AI generated".	Fix a weak line without losing what works.	Three variants turn reviewing into choosing.	Everything stays editable, including the banner.	Only "Save Article" moves the task forward.

Designing for when AI gets it wrong

States for the moments that break trust: waiting, failure, and output that looks fine but isn't.

Regenerating Loading	Generation failed Error	Automated checks Next phase
Previous version kept · Restore	The image service didn't return a banner. Your other edits are saved. Try again Upload	The guaranteed fix for a cluttered garage "Guaranteed" may break Meta ad policy
Only that field loads, and the old version is one click away.	The error stays in its field and always offers a manual way forward.	Flag likely policy issues before a person reviews.

These states were designed for this case study to extend the shipped flow. Automated checks are planned for a later phase.

OUTCOME

Same team. Seven times the output.

Within days of launch, daily output passed 700 creatives, clearing the 500+ needed for profitable scale.

700+	75%	6 → 1	−36
creatives a day, up from 70–100.	less time per article and creative.	tools consolidated into one platform.	manual clicks removed through automation.

Production time per article and creative, before vs. after launch. Daily output is the average over the first week.

LEARNED

Separate the interface from the system. Test the bet earlier.

Make big changes cheap for the team. The wizard was a hard sell until I showed the features and backend would stay the same, and then built the front end myself to keep that promise.

Validate before committing. With one month, the wizard was proven mostly by real use after launch. Next time I'd explore more iterations and run usability tests with daily users first.

TRY IT

Generate an article, then build the creatives.

The same task flow that shipped. Generate an article to unlock the creative builder.

BACKGROUND

Shoppers arrive ready to buy, with little patience.

Roundforest runs high-volume Google campaigns that send shoppers, mostly in the US, to data-driven "Top 10" lists on **BestReviews.Guide**. Every purchase triggered by a click-out earns an Amazon commission, so even tiny friction costs real revenue.

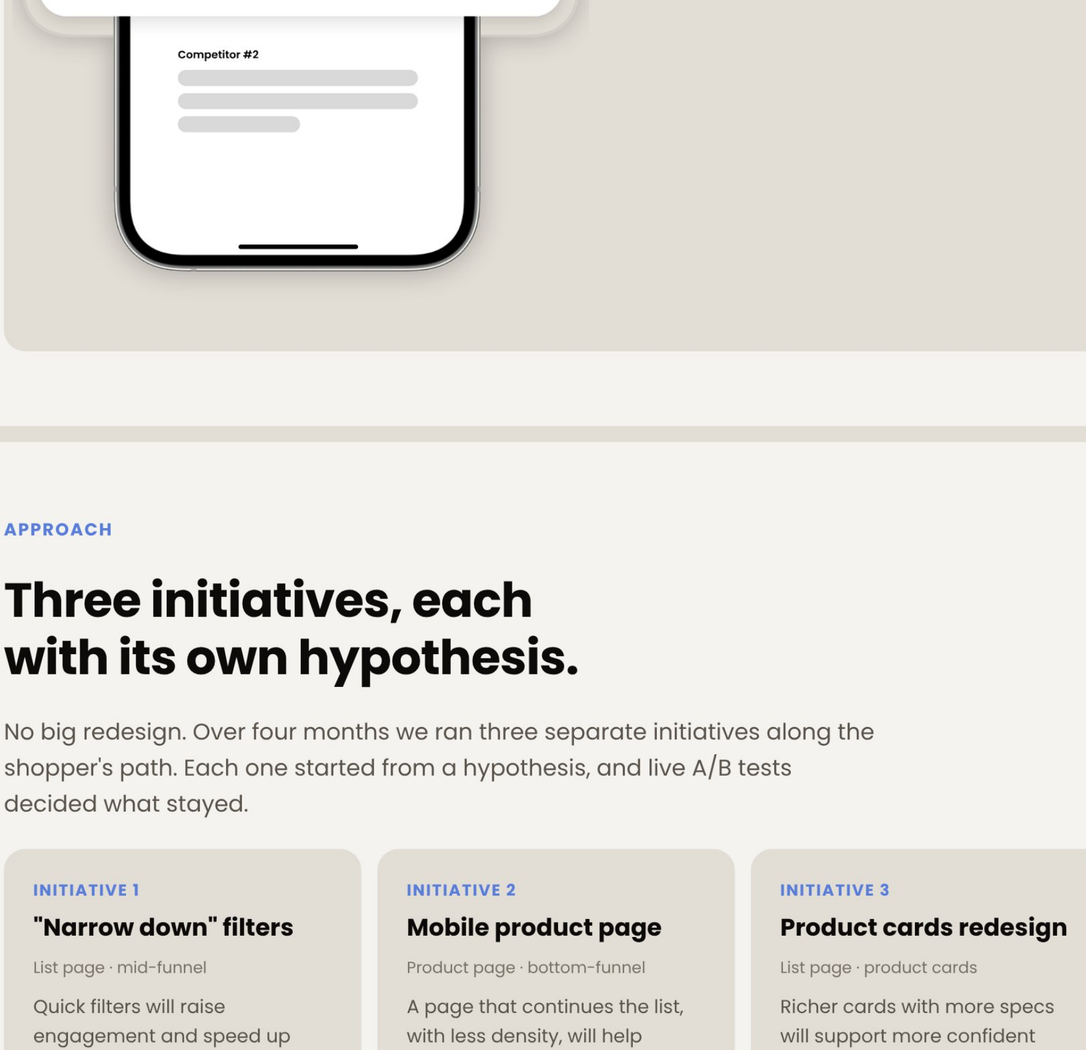
PROBLEM

High traffic, low engagement, and a ranking to protect.

Data showed engagement was too low for our Google ranking. To rank higher we needed more engagement, **without harming click-out rate and conversion**, the metrics that pay.



APPROACH

Three initiatives, each with its own hypothesis.

No big redesign. Over four months we ran three separate initiatives along the shopper's path. Each one started from a hypothesis, and live A/B tests decided what stayed.

INITIATIVE 1
"Narrow down" filters
List page · mid-funnel
Quick filters will raise engagement and speed up buying decisions.
↑ +5% engagement

INITIATIVE 2
Mobile product page
Product page · bottom-funnel
A page that continues the list, with less density, will help shoppers click out with confidence.
Low reach, high purchase rate

INITIATIVE 3
Product cards redesign
List page · product cards
Richer cards with more specs will support more confident decisions.
↓ Hurt click-out

How every test ran

Observe → Hypothesize → Design & A/B test → Scale or drop

INITIATIVE 1 OF 3 · FILTERS

"Narrow down" chips to help shoppers decide faster.

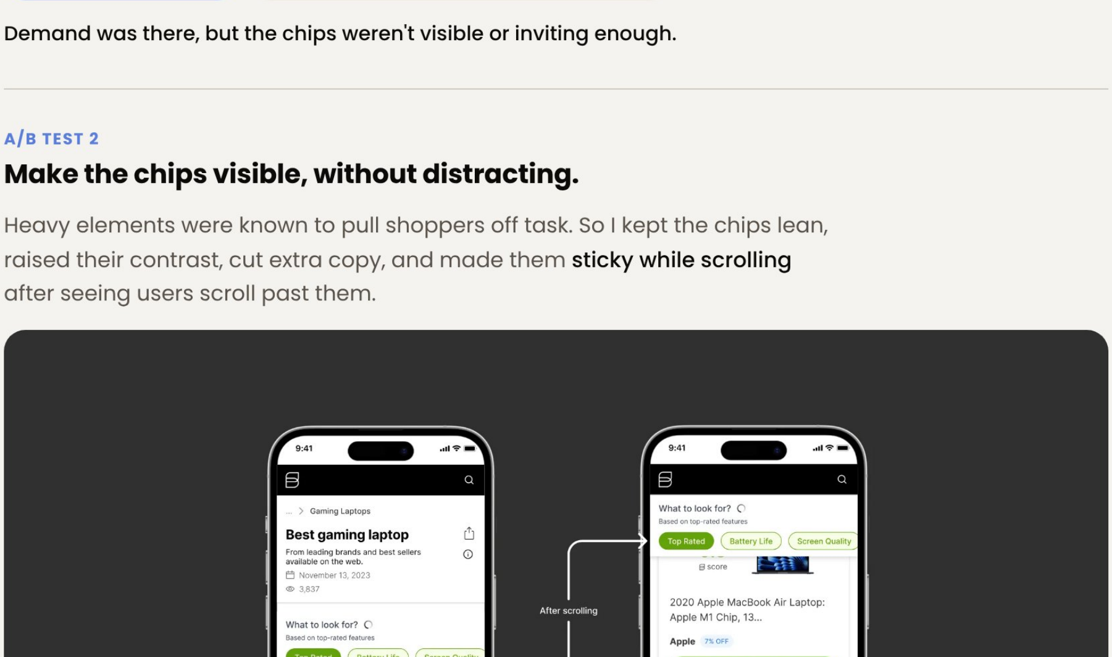
HYPOTHESIS
Giving shoppers quick, clickable filters will raise engagement and guide them to faster buying decisions.

Shoppers arrived with high intent but struggled to find their match in long lists. Inside this initiative we ran three rounds of A/B tests.

A/B TEST 1

Is there demand for filtering?

Two variants against the baseline, to test the concept and refine the copy and interaction.



↑ Significant EPU uplift

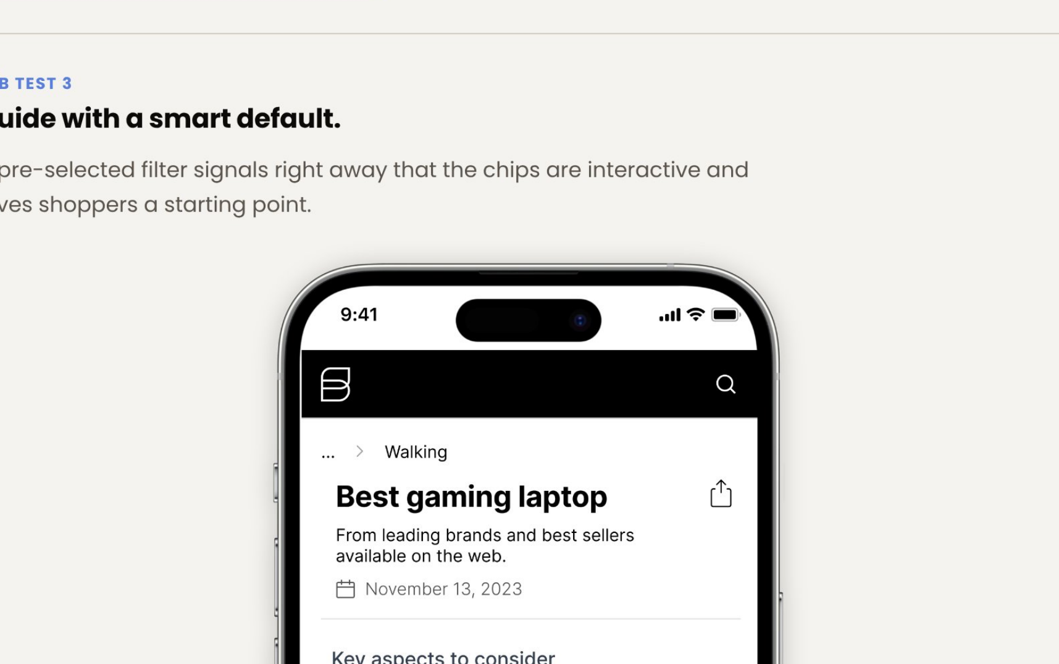
Engagement trending up, not yet significant

Demand was there, but the chips weren't visible or inviting enough.

A/B TEST 2

Make the chips visible, without distracting.

Heavy elements were known to pull shoppers off task. So I kept the chips lean, raised their contrast, cut extra copy, and made them **sticky while scrolling** after seeing users scroll past them.



↑ +5% engagement, statistically significant

A/B TEST 3

Guide with a smart default.

A pre-selected filter signals right away that the chips are interactive and gives shoppers a starting point.

Sponsored

↑ Engagement improved further

INITIATIVE RESULT

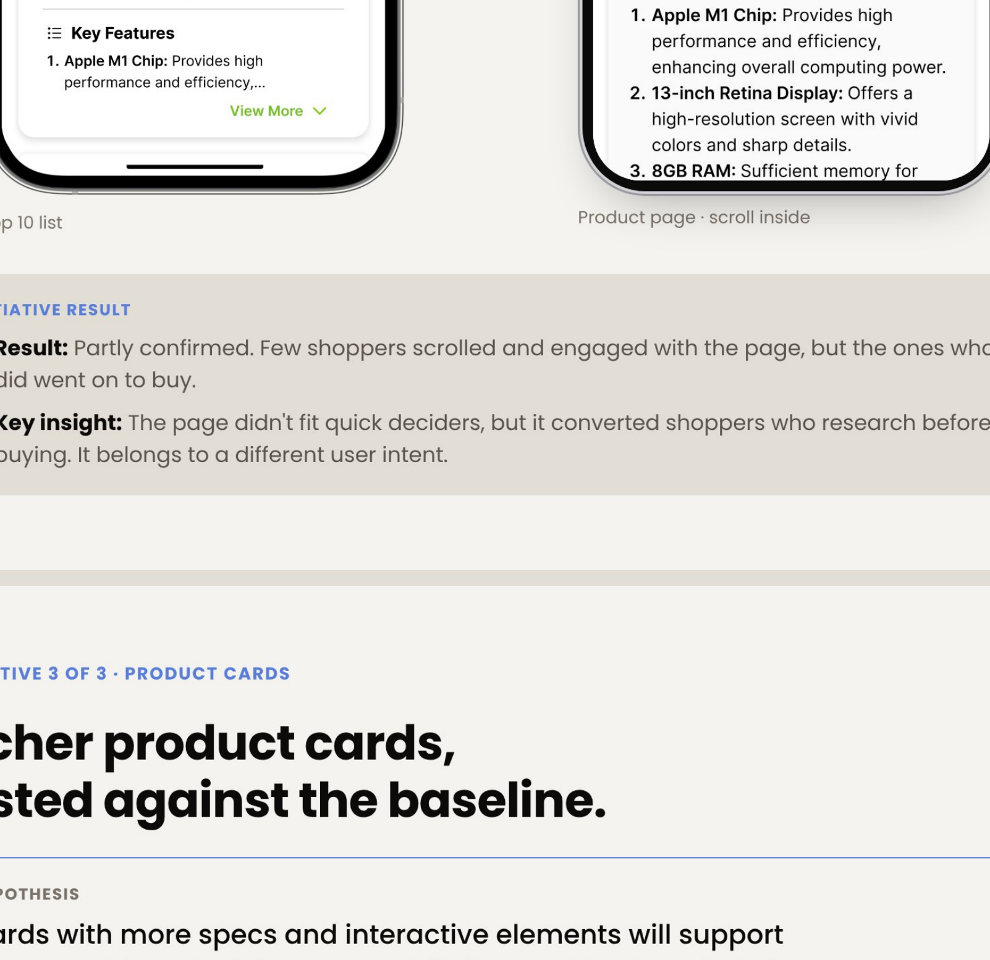
- **Result:** Hypothesis confirmed. Filters raised engagement by 5% and lifted earnings per user.
- **Key insight:** Just having filters on the page made the list feel more credible, and that made shoppers more likely to buy.

INITIATIVE 2 OF 3 · PRODUCT PAGE

A product page that continues the list.

HYPOTHESIS
For fast-scanning mobile shoppers, a product page that keeps the list's patterns and cuts density will reduce friction and lead to more confident click-outs.

Final click-out decisions happen here, and the purchase itself happens on Amazon. I kept the key UI patterns consistent with the list so the whole path feels like one flow.



Best gaming laptop 10 2024 in the United States

Apple 2020 MacBook Air Laptop M1 Chip, 13" Retina Display, 8GB RAM, 256GB SSD...
Key Features
1. Apple M1 Chip: Provides high performance and efficiency, enhancing overall computing power.
2. 13-inch Retina Display: Offers a high-resolution screen with vivid colors and sharp details.
3. 8GB RAM: Sufficient memory for

Top 10 list

Product page · scroll inside

INITIATIVE RESULT

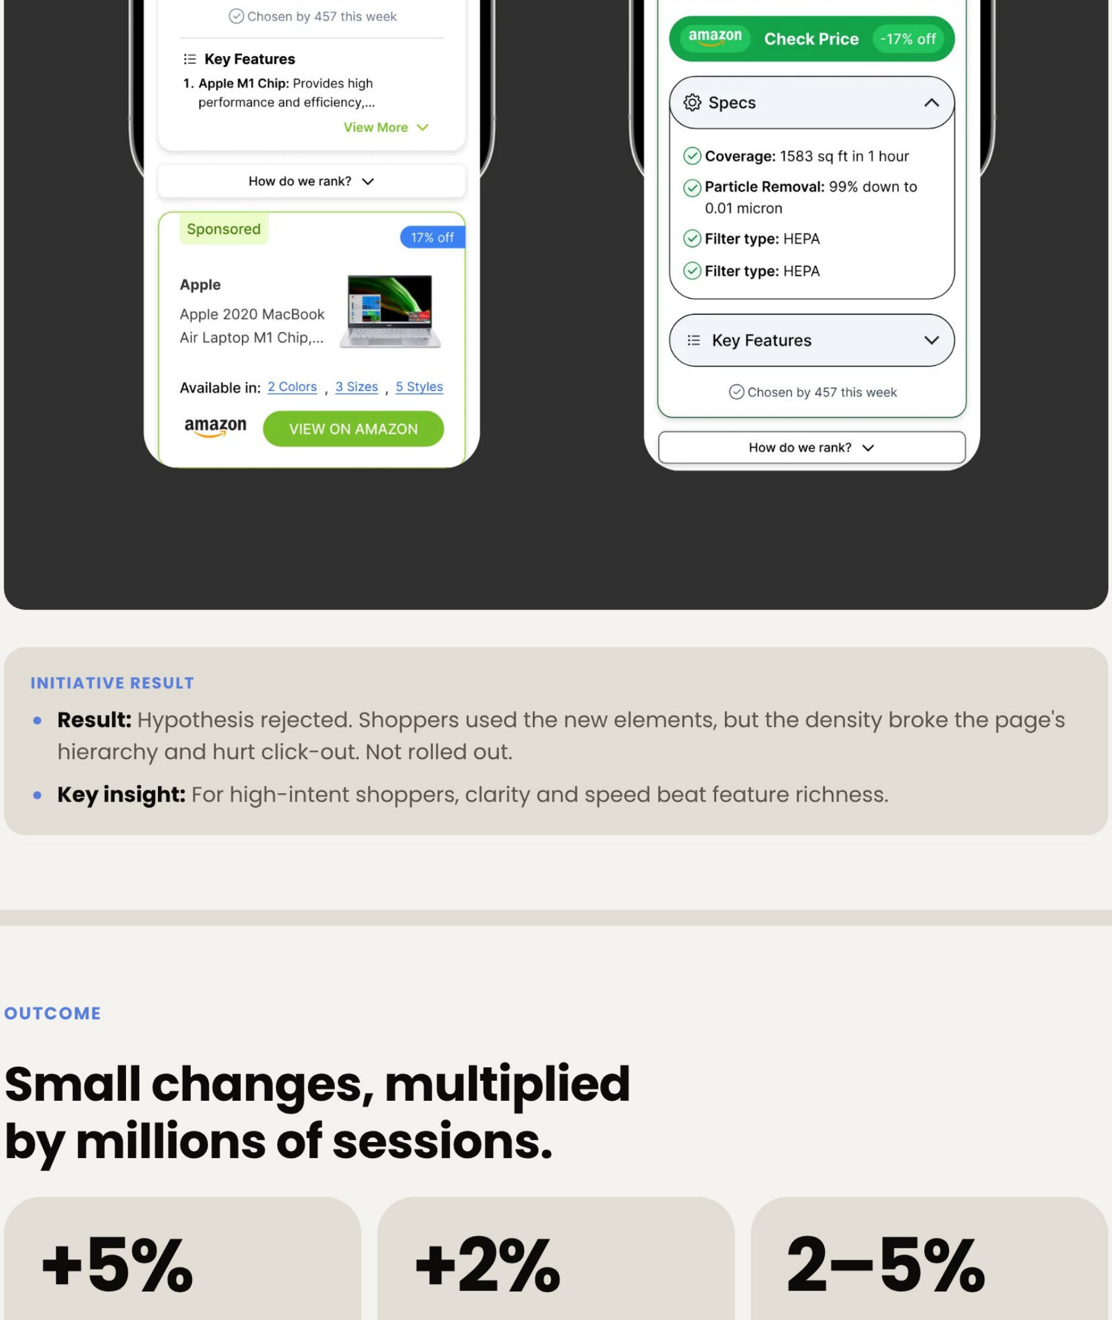
- **Result:** Partly confirmed. Few shoppers scrolled and engaged with the page, but the ones who did went on to buy.
- **Key insight:** The page didn't fit quick deciders, but it converted shoppers who research before buying. It belongs to a different user intent.

INITIATIVE 3 OF 3 · PRODUCT CARDS

Richer product cards, tested against the baseline.

HYPOTHESIS
Cards with more specs and interactive elements will support more confident decisions, especially for an older, less digital-native audience.

I designed the new cards with high contrast, clear borders and strong separation for readability.



INITIATIVE RESULT

- **Result:** Hypothesis rejected. Shoppers used the new elements, but the density broke the page's hierarchy and hurt click-out. Not rolled out.
- **Key insight:** For high-intent shoppers, clarity and speed beat feature richness.

OUTCOME

Small changes, multiplied by millions of sessions.

+5%
engagement, significant once the filters became sticky.

+2%
earnings per user (EPU). At millions of sessions, a major revenue win.

2–5%
uplift in conversion metrics across A/B iterations.

LEARNED

Optimize the signals you can move. Keep mobile simple.

Design for proxy signals. In fast e-commerce, improving upstream behavior like engagement and readability is the most reliable way to move downstream conversion.

Friction compounds at scale. Small UX fixes become significant across millions of sessions.

Mobile needs deliberate simplification. Clarity and low density beat extra features for quick scanners, as the failed experiment showed.

roundforest • B2B SAAS

Turning a mandatory migration into a one-step flow for Amazon sellers.

MY ROLE	TEAM	DURATION
Senior Product Designer Research · UX · UI · Prototyping	**Product · Engineering · CS** Cross-functional squad	**2 months**

TL;DR

Background	Roundforest promotes Amazon sellers who pay above-default commission. The Seller Platform is where they track sales and manage inventory.
Problem	Every seller had to reconnect through Amazon Creator. Existing sellers had no reason to take extra steps in a flow they already knew.
Approach	A backend constraint check showed one campaign ID was enough. I designed a single-input flow that detects every campaign, and rolled it out without blocking anyone.
Outcome	60% of sellers connected in the first week. Average extra commission rose 5% and platform engagement rose 20%.

60%
of sellers connected in week one

+5%
average extra commission

+20%
platform engagement

Background
Problem
Discovery
Insight
Solution
Rollout
Iteration
Outcome

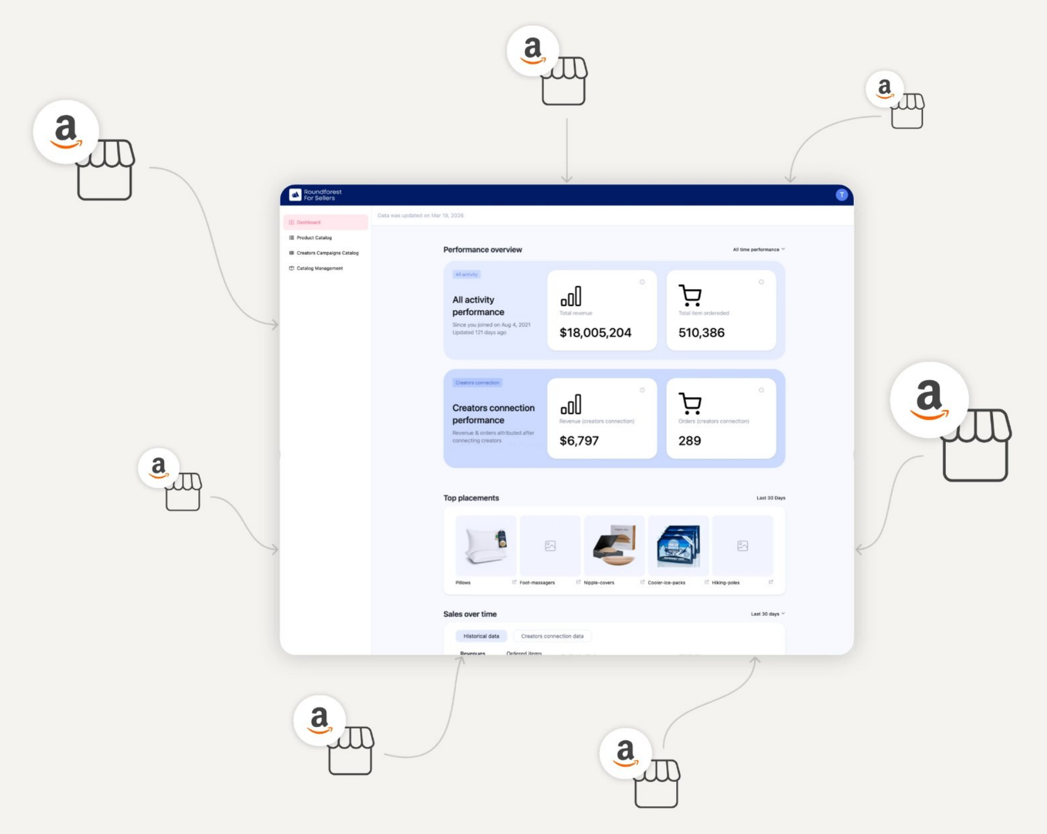
Next

BACKGROUND

Sellers pay for visibility. This is where they watch it work.

Roundforest works with Amazon sellers on a performance-based model. When sellers offer higher commission than Amazon's default, we promote their products and drive more sales. The Seller Platform is the management system where they **track performance and manage inventory** for everything we promote.



PROBLEM

Every seller had to reconnect. The hard part was the ones already happy.

A new requirement meant all sellers had to connect their accounts to the platform through Amazon Creator.

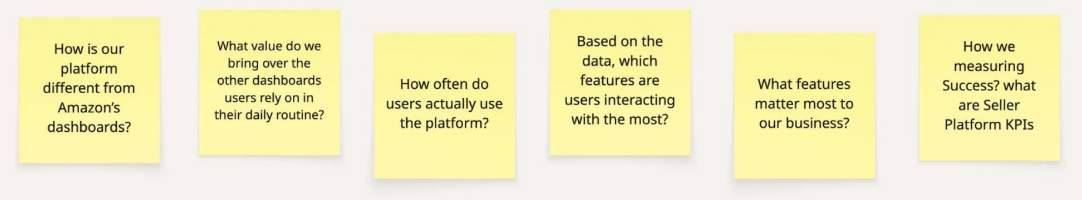
SELLER TYPE 1
New sellers
Joining after the migration. Connecting is just part of onboarding.

SELLER TYPE 2 · THE REAL CHALLENGE
Existing sellers
Already using the platform. We were asking them to take extra steps in a flow they already knew.

DISCOVERY

The platform wasn't a core product, so I learned it from scratch.

I asked every relevant stakeholder how sellers actually use the platform and what the flow looks like from their side. Their answers became the baseline the team designed against.



How is our platform different from Amazon's dashboards?
What value do we bring over the other dashboards users rely on in their daily routine?
How often do users actually use the platform?
Based on the data, which features are users interacting with the most?
What features matter most to our business?
How we measuring Success? what are Seller Platform KPIs

The questions I asked to understand how sellers use the platform

INSIGHT

We only needed one input from the user.

Before designing, I mapped our technical constraints with our senior backend engineer. That meeting reshaped the direction: **from a single campaign ID, the system could detect all of a seller's campaigns** and complete the migration on its own.

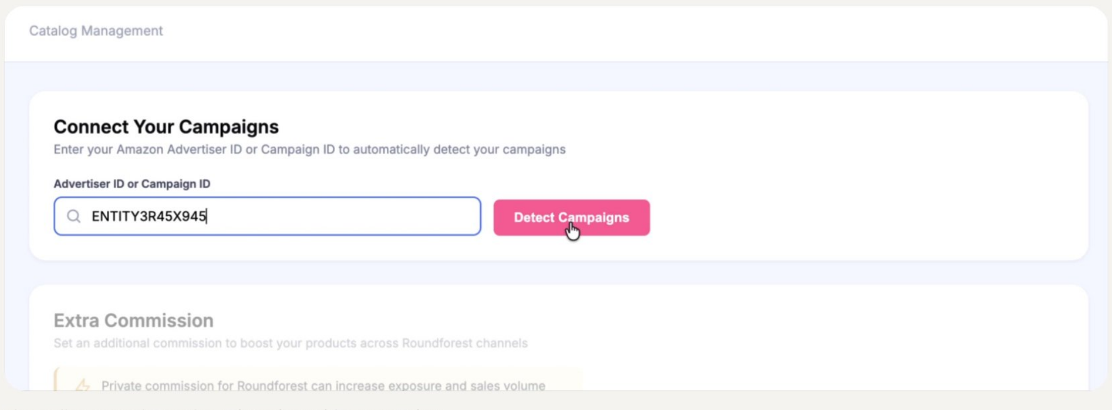
CAMPAIGN ID - 3RPYUKVMH1K4Q ⟶ **All Seller's Campaign IDs** ✓

8GNYUKVMH1K4H
6RPNKKVMHPO9U
56GHUKVMH1M7L
9RPYLNDMH1K6G
2VVYUKVMH1GV5

SOLUTION

One field. The system finds everything else.

One input field → Loading micro-interaction → All campaigns detected



Catalog Management
Connect Your Campaigns
Enter your Amazon Advertiser ID or Campaign ID to automatically detect your campaigns
Advertiser ID or Campaign ID
ENTITY3R45X945
Detect Campaigns
Extra Commission
Set an additional commission to boost your products across Roundforest channels
Private commission for Roundforest can increase exposure and sales volume

The seller completes the migration with one action

Instant feedback
A success banner and micro-interaction confirm the detection.

Trust and validation
The seller's Advertiser ID appears in the banner as proof the system recognised them.

Contextual guidance
The field's title and helper text explain auto-detection up front.

Conditional access
"Extra commission" stays disabled until the connection is done, so sellers finish connecting first.

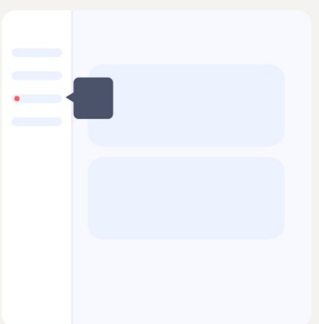
ROLLOUT

Tell sellers about it without blocking their work.

I compared three ways to announce the change. The priority was keeping the existing workflow intact.

OPTION 1
Forced onboarding
Block login until the connection is complete.
Risk: high friction and instant frustration.

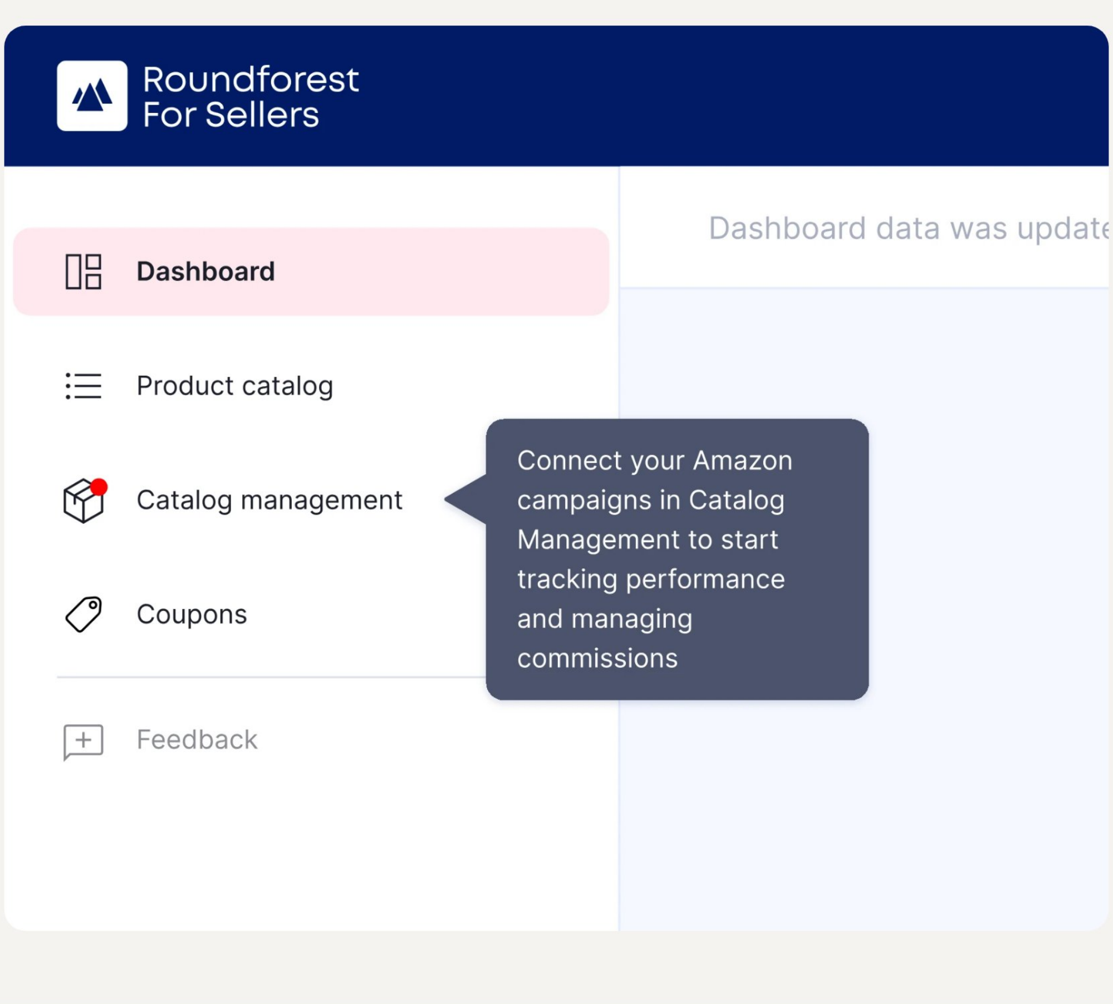
OPTION 2
Persistent banners
A modal on login, then a global header banner.
Risk: banner blindness and clutter.



OPTION 3 CHOSEN
Contextual discovery
Leave the workflow alone and add a targeted sidebar tooltip next to the new Catalog Management page, plus an email explaining the value.

The chosen option, live in the product

A tooltip next to Catalog Management invites sellers to connect, without interrupting their work.



Connect your Amazon campaigns in Catalog Management to start tracking performance and managing commissions

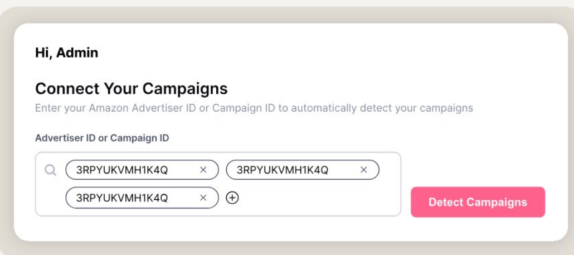
ITERATION

Sellers didn't realise one ID connects everything.

We launched under time pressure, so we monitored usage and feedback from day one and shipped fixes as soon as friction showed up.

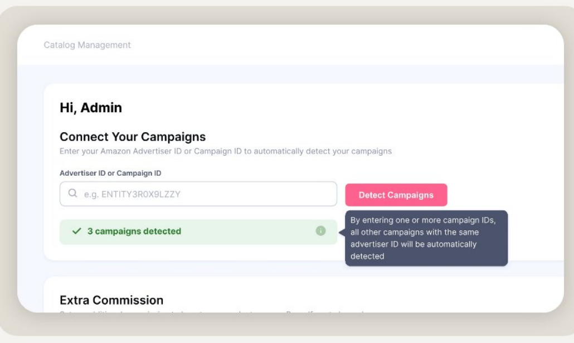
OBSERVATION Users didn't fully understand that one campaign ID connects all their campaigns. Many also kept their IDs in spreadsheets.

FIX 1
Bulk campaign input
Sellers paste IDs straight from their spreadsheets into the field.



Hi, Admin
Connect Your Campaigns
Enter your Amazon Advertiser ID or Campaign ID to automatically detect your campaigns
Advertiser ID or Campaign ID
3RPYUKVMH1K4Q
3RPYUKVMH1K4Q
3RPYUKVMH1K4Q
Detect Campaigns

FIX 2
Explanatory tooltip
A tooltip on the field explains the behaviour and prevents confusion.



By entering one or more campaign IDs, all other campaigns with the same advertiser ID will be automatically detected

OUTCOME

Most sellers connected in the first week.

60%
of sellers completed the connection within the first week of launch.

+5%
average extra commission, directly boosting company revenue.

+20%
platform engagement, with sellers spending more time on their synced campaigns.

LEARNED

Talk to engineering before sketching. Ship with eyes open.

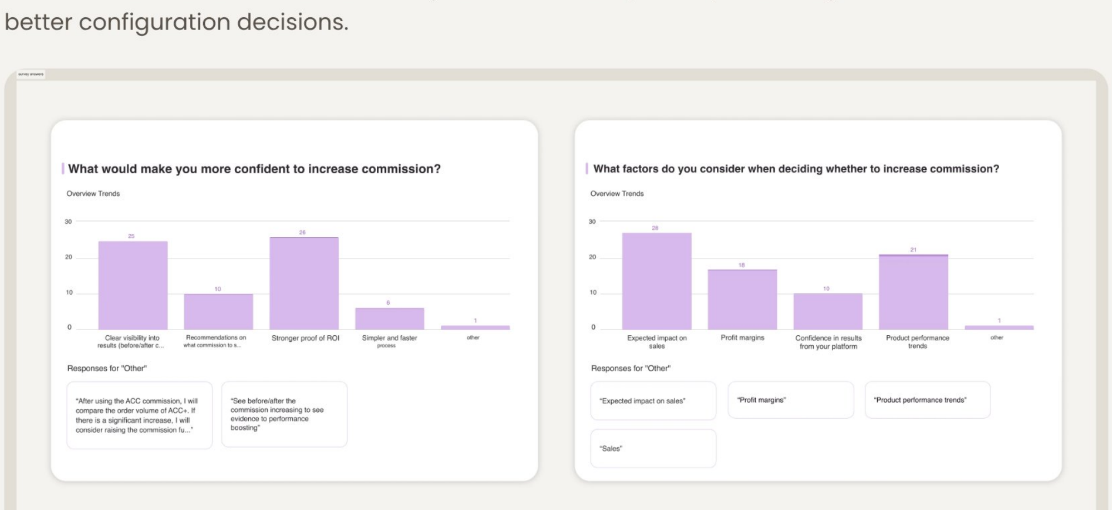
Constraints first. One meeting with backend changed the whole design from a multi-step form to a single field. If I had started in Figma, I'd have polished the wrong flow.

Launch small and watch closely. We didn't have time to test everything before launch, so we planned for fast fixes instead. Bulk input came straight from seeing how sellers really store their IDs.

NEXT

Sellers asked to see what their choices earned them.

With the migration done, I surveyed sellers about how they track performance. They wanted a **before-and-after view** of how configuration choices affected sales. That ROI view gives sellers transparency and nudges better configuration decisions.



"After using the ACC commission, I will compare the order volume of ACC+. If there is a significant increase, I will consider raising the commission fu..."

"See before/after the commission increasing to see evidence to performance boosting"

"Expected impact on sales"

"Profit margins"

"Product performance trends"

"Sales"

A sneak peek at the survey

Unit.e.p App Oketz Unit Sorting

A digital evaluation platform for the IDF's elite canine unit (Oketz) — turning their high-stakes annual sorting camp into a centralized, live diagnostic system.

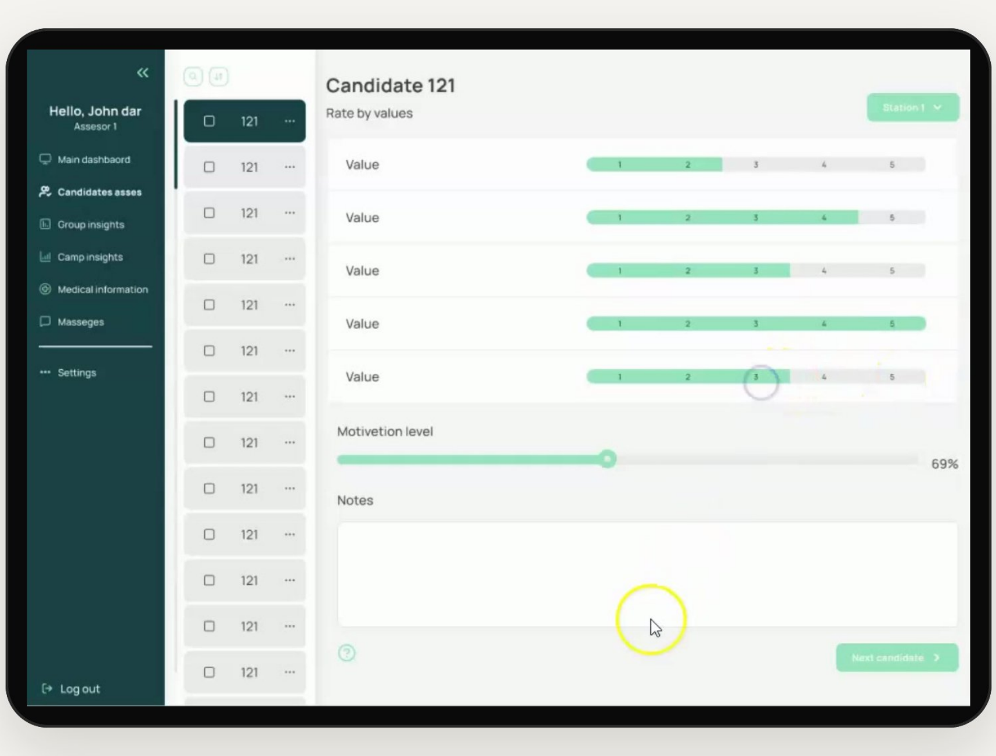
MY ROLE	TEAM	DURATION
Solo Product Designer	**Design · Behavioral · Engineering**	**6 months**
Freelance · Research · UX · UI · Prototyping	1 Social Behavioral Commander · 1 Engineer	End-to-end engagement

OVERVIEW

Overview

O-Assessment System (Unit.e.p app) is a custom, complex digital evaluation platform built for the IDF's elite canine unit (Oketz) to optimize their high-stakes annual candidate sorting camp through a centralized, live diagnostic ecosystem.

It replaces paper-and-pen scoring with centralized digital trackers that map candidate parameters, groups, and stations - and processes candidate rankings in real time, making data visible and syncable immediately rather than after the camp ends.



Challenge →

Held once a year under intense field conditions, the sorting camp tracked candidate metrics by hand - creating disconnected data silos and a grueling 3-hour end-of-camp alignment meeting that delayed reserve officers and formed a major administrative bottleneck.

Strategy →

Design a custom, end-to-end mobile (tablet) platform engineered for extreme field conditions - unifying raw observations, real-time tracking, and automated score compiling into a single interface to eliminate post-camp operational drag.

Results →

A semi-automated field assessment interface that streamlined information architecture, cut post-camp alignment and grading time, and gave assessors instant, analytical visibility over candidate scores for the first time.

DEFINING THE PROBLEM

How can we unify all field observations into one smooth digital workflow?

The assessors managed a fragmented, manual workflow - tracking fast-paced data points on paper logs before manually syncing with multiple departments:

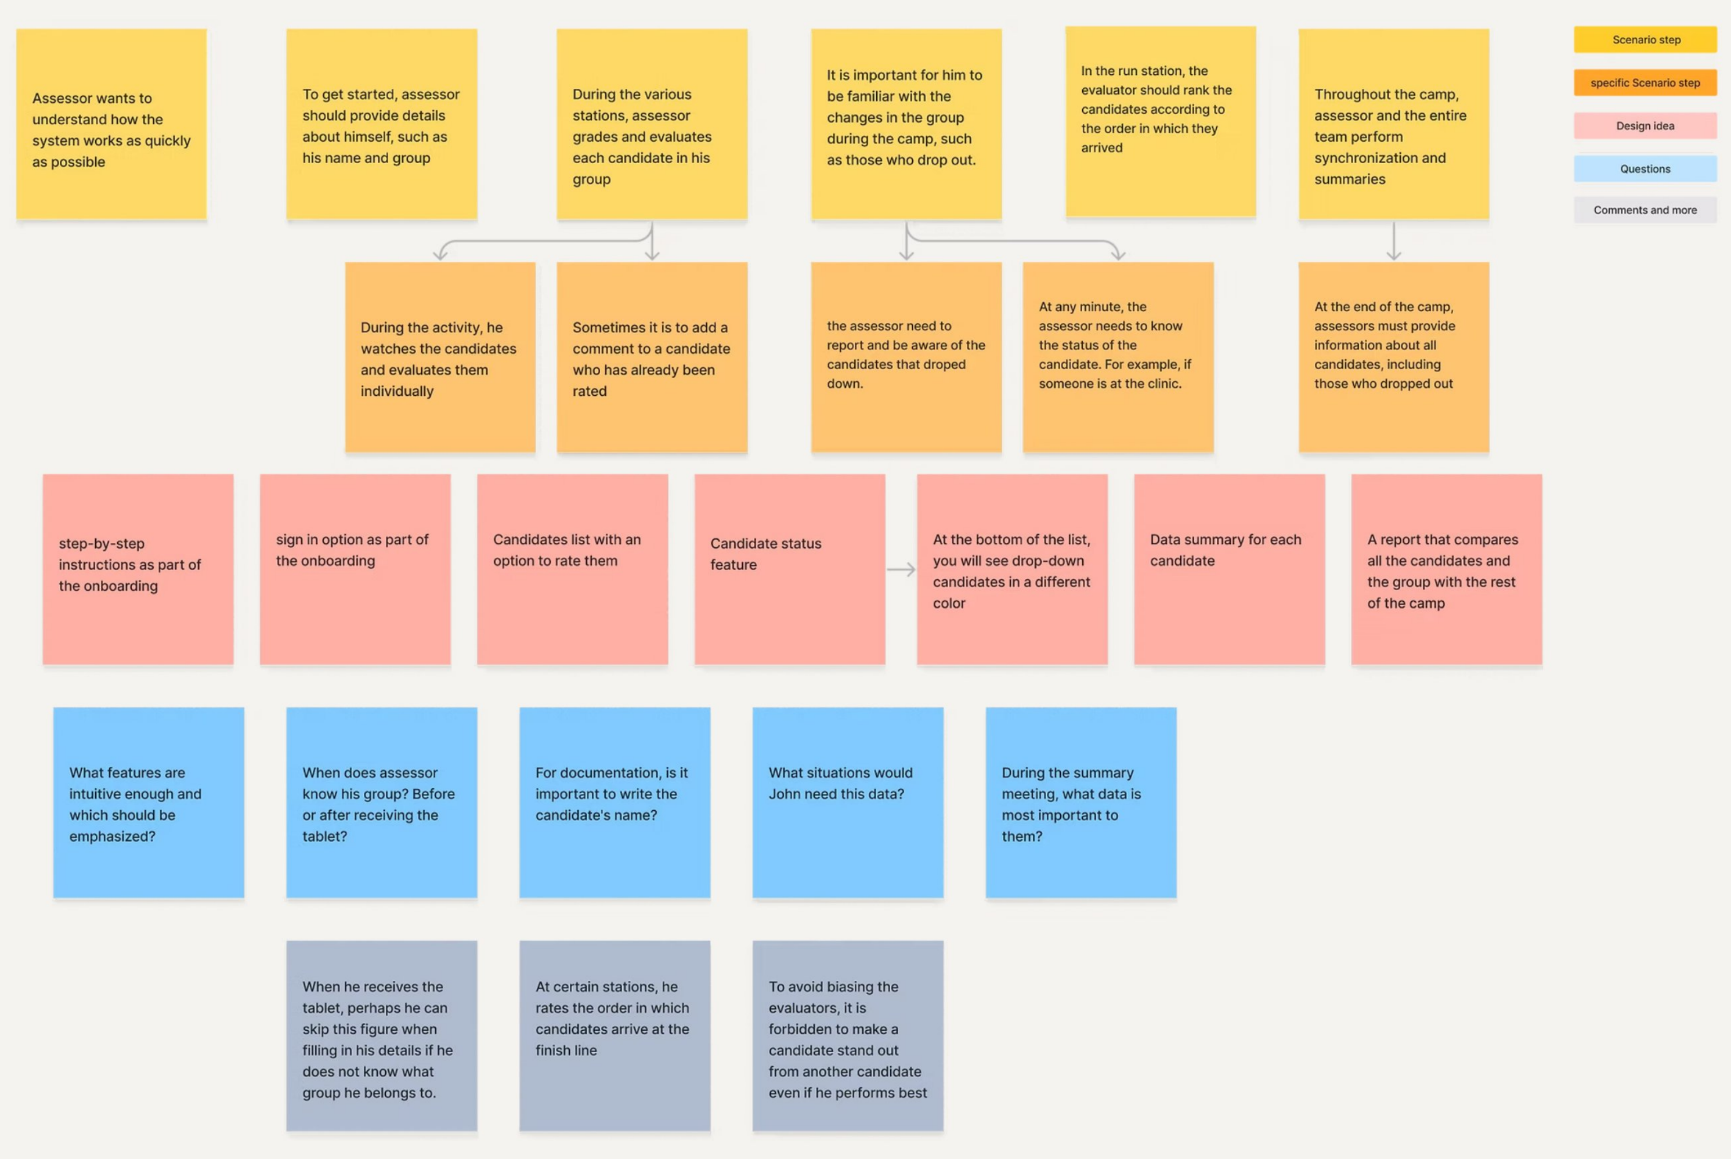
- **Physical Paper Forms:** Every candidate parameter was captured by hand on printed logs across distinct physical stations.
- **Manual Drawings & Tables:** At the fast-paced sprint station, assessors resorted to scribbling circles and numbers to track arrival sequences.
- **3-Hour Cross-Department Sync:** Aligning all raw observations required a grueling manual meeting at the end of the camp - the core bottleneck.

To solve this, I conducted extensive user research - interviewing the camp's director board, commanders, and assessors - and paired this with direct on-the-ground observations during the active sorting camp to identify exactly where paper logs failed.

STRATEGY & EXPLORATION

User Flow Mapping

After organizing my field notes and sticky-note affinity mapping, I structured an optimized user flow. This architecture defined how field inputs immediately convert into synchronized system data - paving the way for a continuous, automated flow from live trial to final ranking.



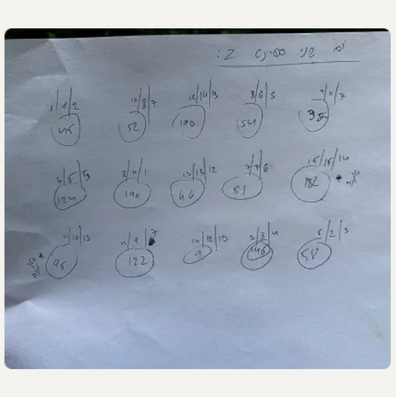
Assessor wants to understand how the system works as quickly as possible
To get started, assessor should provide details about himself, such as his name and group
During the various stations, assessor grades and evaluates each candidate in his group
It is important for him to be familiar with the changes in the group during the camp, such as those who drop out.
In the run station, the evaluator should rank the candidates according to the order in which they arrived
Throughout the camp, assessor and the entire team perform synchronization and summaries
Scenario step
specific Scenario step
Design idea
Questions
Comments and more
During the activity, he watches the candidates and evaluates them individually
Sometimes it is to add a comment to a candidate who has already been rated
the assessor need to report and be aware of the candidates that droped down.
At any minute, the assessor needs to know the status of the candidate. For example, if someone is at the clinic.
At the end of the camp, assessors must provide information about all candidates, including those who dropped out
step-by-step instructions as part of the onboarding
sign in option as part of the onboarding
Candidates list with an option to rate them
Candidate status feature
At the bottom of the list, you will see drop-down candidates in a different color
Data summary for each candidate
A report that compares all the candidates and the group with the rest of the camp
What features are intuitive enough and which should be emphasized?
When does assessor know his group? Before or after receiving the tablet?
For documentation, is it important to write the candidate's name?
What situations would John need this data?
During the summary meeting, what data is most important to them?
When he receives the tablet, perhaps he can skip this figure when filling in his details if he does not know what group he belongs to.
At certain stations, he rates the order in which candidates arrive at the finish line
To avoid biasing the evaluators, it is forbidden to make a candidate stand out from another candidate even if he performs best

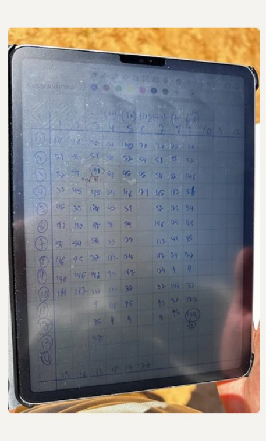
Product Context

Prior to this design, the sorting camp had absolutely no digital interface for real-time calculation, leaving assessors isolated from statistical analysis. I transformed this entirely manual, paper-heavy environment into a holistic, digital internal platform capable of coordinating field data with administrative decision-makers instantly.

Before & After

- **Before the redesign:** Handwritten logs, manual paper drawings, and un-synced spreadsheets.



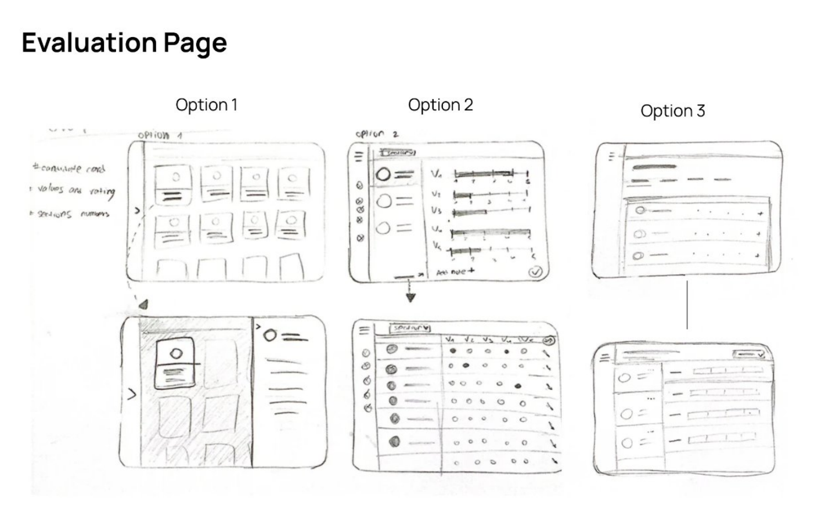


- **After the redesign:** A centralized digital dashboard with real-time field evaluation inputs.

Sketching to Think

I started with hand sketches to visualize the design. They let me get every idea from the research stage and the design process onto paper, so I could see what worked and what didn't.

These wireframes show the evaluation page: how the candidate list is arranged, and what is determined by the configuration of other features and components.

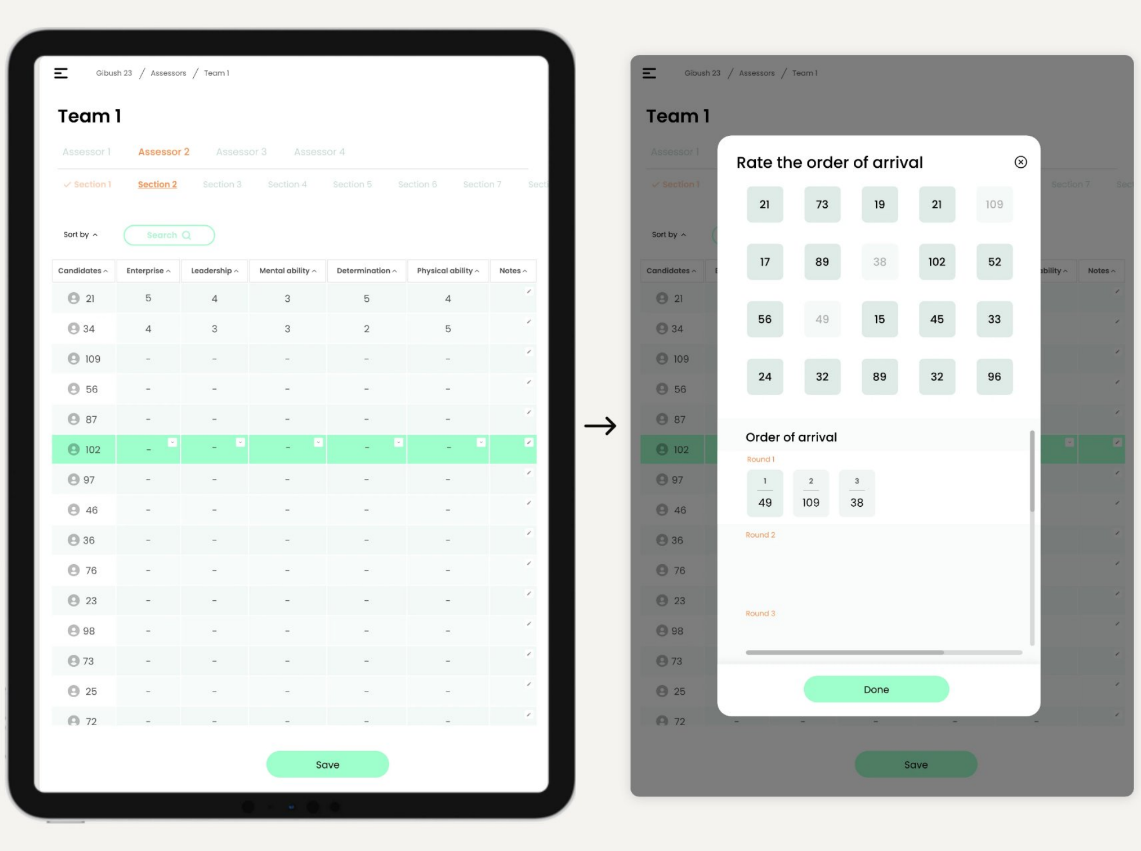


DESIGN SOLUTIONS

From complex data entries to simple, sequential workflows

By anchoring the interface around the structural journey of the camp - Candidate → Group Assignment → Station Observations → Final Board Review - I turned complex data entries into simple, sequential workflows.

Here is the first iteration:



First Iteration: Pros & Cons

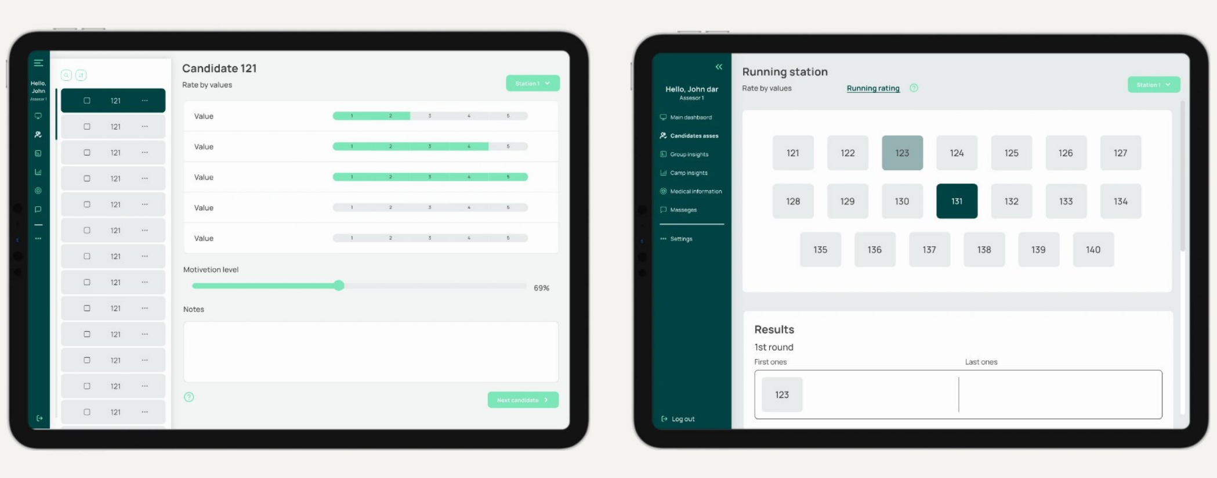
Pros

- Similar to other products that are familiar to the user.

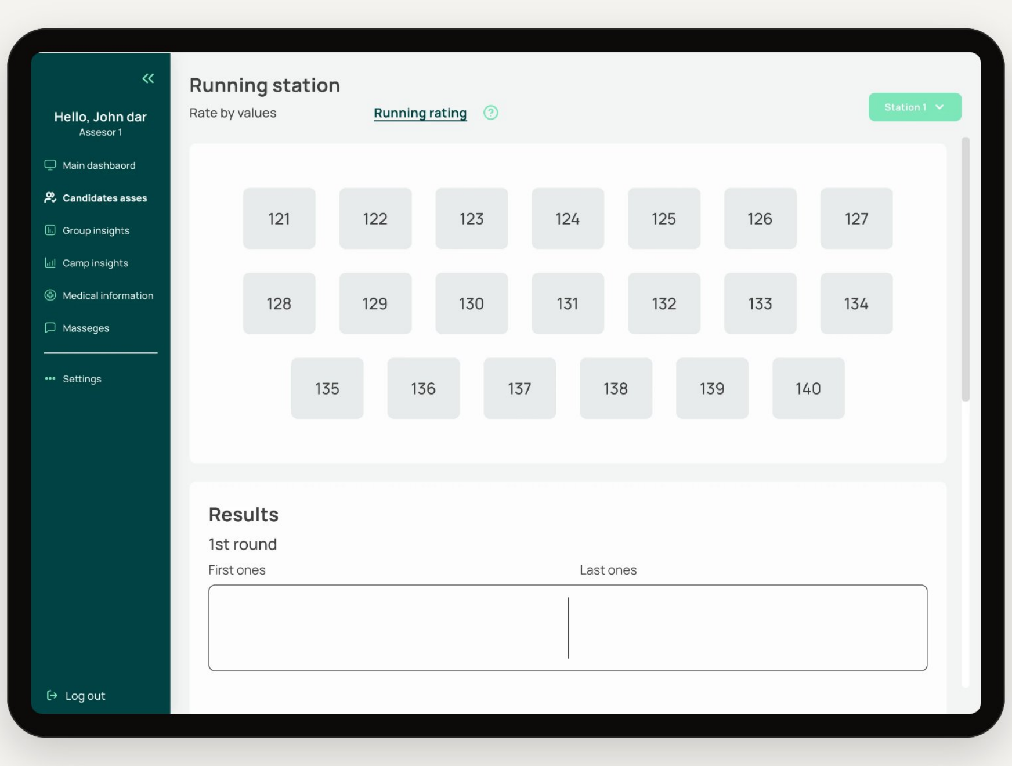
Cons

- Does not perfectly fit the activities in the field.
- Lacking navigation.

I went through a few more iterations until I arrived at this one



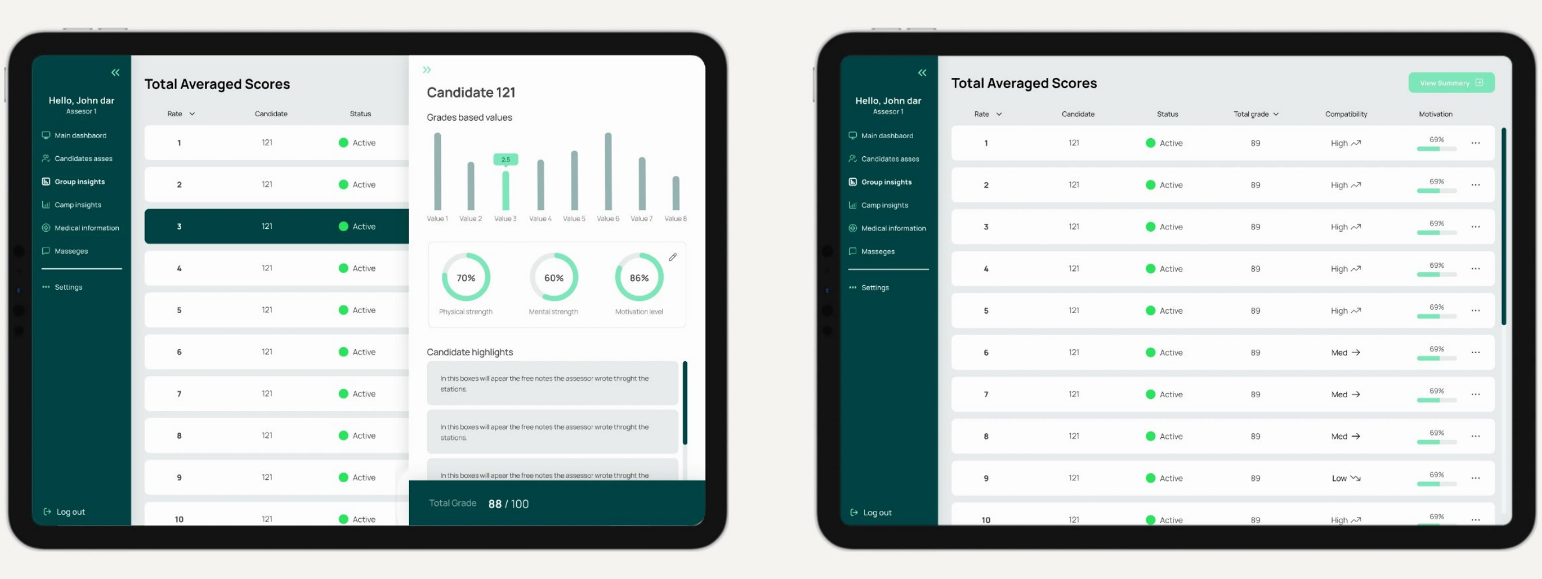
Running station flow animation



Designed for the Tablet and the Field

I sized the buttons for the interface they live in, so they are easy to tap. A side navbar and a candidate list sized for finger interaction keep the screen comfortable to use in the field. The layout is adjusted to the tablet's width.

To keep the flow uninterrupted, I kept the tabs of the running station and the assessment form on the same screen. Selecting a candidate from the list on the left opens their evaluation page. The button at the top right lets the user move between the stations scheduled for that day.



Connecting Assessment & Evaluation creation flow

A key design challenge was managing functional dependencies. To rate a candidate's high-level behavioral attributes, an assessor first needed to input structural data from specific station tasks (like sprint times or drill performance). I designed a nested interface that structurally enforces this operational sequence.

The final candidate summary score remains inactive until granular task parameters are entered. Once those field trials are populated, the system automatically aggregates the analytics - unlocking the macro review pipeline in a single view.

Balancing Automation with User Control

When the final grading process finishes, the candidate task row changes states to visually signal completion. I intentionally preserved a manual final "Sign-off" check.

Because these evaluations determine a candidate's military placement and future trajectory, a fully automated decision engine would introduce user anxiety and operational distrust. Giving commanders final approval authority maintains psychological safety and human oversight.

RESULTS

The Impact

I replaced paper-based logs with a semi-automated field assessment interface. This solution streamlined information architecture, cutting post-camp alignment and grading time while giving assessors instant, analytical visibility over candidate scores for the first time.

3 Hours
of post-camp cross-department alignment meetings eliminated.

Real-Time
candidate scoring visibility for assessors - available for the first time.

Zero
paper logs - replaced by a centralized digital field interface.
